BAD POSITION CAUSED BY SITTING AT TOO HIGH A TABLE

BAD POSITION WHEN WRITING

AN EXAMINATION OF PRIMARY SCHOOLS.

One hundred and seventy-four National Schools were subjected to a minute examination. The Primary Schools under the management of the Christian Brothers and the Church Education Society were not examined as yet.

The following are obviously the conditions under which school life should be passed :—

Ample square and cubic space. A temperature in winter of 60° F., or, certainly, not lower than 56° F. Good ventilation. Sufficient light. A place for containing overcoats, caps or hats and umbrellas. A supply of water for drinking and for washing when the pupils required it. Ample sanitary accommodation of up-to-date pattern. The seats and desks should be adapted to the stature of the pupils. Exercise and play grounds of sufficient size. Instruction should be given in Elementary Hygiene. Girls' Cookery Classes would be valuable. Children under 5 years of age should not be admitted. Medical inspection and examination of the teeth would be desirable.

There are many Schools which are up to a high standard, from a Sanitary point of view, but a much larger number are far from being in a satisfactory condition.

In 1810, Dr. R. Carmichael proved that the prevalence of Consumption and Scrofula amongst children in many of the Dublin schools was not due to deficiency of food but to defective ventilation. In the Children's School of the House of Industry he found the cases of Scrofula so numerous that the disease was regarded as an epidemic. Neil Arnott long ago declaimed against the insanitary

6140 (1911)

conditions which were common in the schools of his day. Of late years there has been great improvements in the condition of schools, but many still remain in a very defective state. Pure atmospheric air contains 4 parts of carbonic acid per 10,000 parts of air. An increase beyond that proportion indicates impurity—the greater the increase the greater the impurity. The law requires that the amount of carbonic acid in the Weaving Sheds in England shall not contain more than 9 parts of carbonic acid per 1,000 parts of air. Dr. Percy Frankland found much larger amounts in the air of schools. Sir Henry Roscoe found 23.71 parts per 10,000 of air; and in another school, 31 parts. If it is necessary to limit the amount of carbonic acid in factories, why not also in schools?

The English Education Department requires that the minimal cubic space per pupil should be 130 for general schools' rooms. The London School Board requires 100 cubic feet as minimal. 12 square feet will not be too much.

In the 172 Primary Schools visited, the cubic space per pupil varied from 50 cubic feet in John's Lane School, to 554.4 in Hardwicke Street School.

The square space varied from 5 square feet in John's Lane School, to 46.2 in Hardwicke Street School.

In Leeson Lane, and St. Audoen's (High Street) Schools, there were only 5 square feet. In Fairview Infant School there were 5 square feet per infant; 10 would not be too much.

The above figures show that in many of the schools there is overcrowding.

The greatest defect in the Dublin schools is the want of seats and desks adapted to the height of the children. If it be necessary to group children together according to their educational and not their physical standard desks of uniform height should not be used. There are

numerous improved forms of seats and desks adapted to the height of pupils, but they are in very little use in Dublin. The seats should incline slightly to the back, and when the pupil's thigh and calf are at right angles the foot should rest squarely on the floor. The forearm should be supported on the desk without the body having to be stooped. If the desk is too high, there is straining of the arm, which may lead to curvature of the spine.

Dr. Guillaume gives a table showing the proper height of desks and seats for children :—

Height of Pupil.		Height of Desk		Height of Seat.	
feet	inches	feet	inches	inches	inches
3	0	3	3	13.5	7.5
3	3	3	6	14.7	8.8
3	6	3	9	15.8	9.5
3	9	4	2	17	10.3
4	2	4	5	18.1	11.2
4	5	4	8	19.2	12.2
4	8	5	1	20.4	13.1
5	1	5	4	21.6	14.1

The following are examples of children of very different heights seated on seats and using desks of the same size :—

Vernon Avenue School—tallest pupil, 5 feet 6 inches ; shortest, 3 feet 9 inches. Howth Road School—tallest boy, 5 feet 11 inches ; shortest, 4 feet. St. Luke's School, New Street—Height of seats, 1 foot 3 inches ; height of desks, 2 feet 3 inches ; height of pupils, from 3 feet 2 inches to 5 feet. Model School, Glasnevin—All the desks of same height—2 feet 3 inches ; tallest pupil, 5 feet ; shortest, 3 feet 3 inches—difference, 1 foot 9 inches.

The best temperature for study is about 60° F. Schools are often too cold for children, for they require a higher temperature than adults. The temperature in cold weather should be maintained by means of open fire places (which help ventilation), and by steam or hot

water pipes. When open grates alone are used, the distribution of heat throughout the rooms is not uniform. Some of the children receive more heat than others. Only 2 of the 174 schools—St. Catherine's, Donore Avenue, and George's Hill Convent School—are heated with open fire places and hot water pipes. St. George's School, Lower Sherrard Street; St. Andrew's School, Dolphin's Barn; St. Gabriel's School, Cowper Street; St. Peter's School, Whitefriar Street; Inchicore Central National School; and the Jewish School, Adelaide Road, are heated by pipes. All the other schools are heated by open grates or, in a few instances, stoves, heated by coal or gas.

On the whole, there is not sufficient sanitary accommodation in the schools. North Strand National School has 66 pupils, and only one w.c., whilst a school in Lower Sherrard Street, with 70 pupils, has 4. St. Paul's School, Blackhall Parade, has one w.c. per 50 pupils. Meath Street National School has 216 pupils on its books, but has only 3 w.c.'s.; on the other hand, St. Michael's and John's School, Lower Exchange Street, is provided with 4 w.c.'s. and 2 urinals. St. Kevin's School, Blackpitts, has 357 pupils on its books, but only 3 trough closets, in line, and a urinal divided into 6 compartments.

In the Female Schools, Lower Sherrard Street, 80 pupils (on books) have 6 w.c.'s.; this is satisfactory. Denmark Street Schools have 300 pupils and 4 trough closets. The West Dublin Model School, School Street, is well provided, having for 100 pupils 13 wash-out w.c.'s. Leeson Lane National School has 1 w.c. per 100 pupils. Weavers' Square—pupils on books, 1,166; average attendance, 808; number of w.c.'s., 8. Baggot Street National School—pupils on book, 1,536; 4 wash-down and 4 trough w.c.'s.

In the majority of the schools ventilation is effected by means of doors, windows, open fire places, and ventilators in walls or roofs; but a large majority have no special ventilators. In many of the Schools Tobin's tubes might be placed with advantage. In the great majority of the schools the lighting is good.

The majority of the schools have sufficient space for physical exercise, but the tables show that in many instances the play grounds are too small.

In rooms in which scores of children spend several hours daily it is not improbable that they might become infected with the micro-organisms of disease, such as those of tuberculosis. It would be desirable to subject the schools to a thorough disinfection occasionally, say during holidays.

The inspection of schools has been carried out with the view of inducing those who have charge of them to remedy any defects that might be found in them. It seemed desirable that the condition of the schools at the present time should be recorded, and it is to be hoped that a future close inspection may discover that great improvements have been carried out.

The English Board of Education state the following Sanitary accommodation to be requisite:—

		For Girls	For Boys	For Infants	For Girls & Infants
Under	30 Children	2	1	2	2
„	50 „	3	2	3	3
„	70 „	4	2	3	4
„	100 „	5	3	4	5
„	150 „	6	3	5	6
„	200 „	8	4	6	7
„	300 „	12	5	8	8

There should be urinals in the proportion of 10 feet per 100 boys.
